                                                                 5
                                                                                                                                                                          The present sequence is the human WSX receptor variant 13.2, which can be used to identify and purify ligands and activators. An anti-WSX receptor antibody can be used as an agonist to activate the WSX receptor, leading to enhanced proliferation or differentiation of a cell expressing the WSX receptor. It can also be used to decrease body weight and/or fat-depot weight and/or food intake in an obese mammal. WSX receptor ligands can be used to enhance proliferation or differentiation of lymphoid, myeloid or expthroid blood cell lineages. This is useful when a mammal, capacially a human, is suffering from decreased blood cell levels, i.e. anaemia, caused by chemotherapy, radiation therapy or bone marrow transplantation therapy. It can also be used to repopulate blood cells in a mammal. The products can also be used to treat, e.g. neoplastic disorders, arteriosclerosis, Type II diabetes, polycystic ovarian disease, cardiovascular diseases, condition insuling conditions of the products of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product

ObR protein participates in the regulation of mammalian body weight. The invention also relates to a method of identifying therapeutic compounds for the treatment of a body weight disorder. The method involves contacting a cell that expresses a mammalian ObR protein, a JAK2 protein and a mammalian SOCS-1 protein with a test compound. The method is useful for identifying compounds which modulate ObR gene expression and gene product activity, which can be used as agents to control body weight particularly as therapeutic agents for treating body weight disorders, including obesity, cachexia and anorexia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying compounds for treating bod anorexia or cachexia, comprises contac receptor protein, JAK2 protein and mam
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      WPI; 2001-624489/72.

The patent discloses obese receptor (ObR) proteins and nucleic acids encoding them. ObR protein participates in the regulation of mammalian to body weight. The invention also relates to a method of identifying therapeutic compounds for the treatment of a body weight disorder. The method involves contacting a cell that expresses a mammalian ObR compound. The method is useful for identifying compounds which modulate ObR gene expression and a mammalian SOCS-1 protein with a test compound. The method is useful for identifying compounds which modulate ObR gene expression and gene product activity, which cap be used as the control body weight particularly as therapeutic agents for treating body weight disorders, including obesity, cachexia and anorexia. The present sequence is human ObR protein mutant (Y1141F).

Note: This sequence is not shown in the specification but is derived the wild-type human ObR protein shown in figure 3 of the capting of the capting obesity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                   몽
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention provides a method for identifying modulators of binding of CC a phosphorylated leptin receptor with tyrosine phosphatase 1D PTP-1D). CC The method comprises: (a) contacting a tyrosine-985 phosphorylated leptin receptor or its phosphorylated fragment with protein PTP-1D or its CC fragment in the presence and absence of a candidate agent under CC conditions in which in the absence of the agent the binding of the CC phosphorylated leptin receptor or fragment with PTP-1D or its fragment CC can be detected; and (b) detecting the binding of the phosphorylated CC leptin receptor and PTP 1D; where an increase in binding detected in the CC presence of the agent, indicates that the agent indicates binding, and a decrease in binding in the presence of the agent indicates; that the agent is a binding inhibitor. Modulators of tyrosine-985-phosphorylated leptin CC receptor-dependent PTP-1D phosphorylation are useful as drugs in weight CC loss diet regimens. The drugs identified can regulate adiposity and fat content of animals, particularly in mammals. Disorders that can be treated by PTP-1D modulators include obesity and its associated diseases, ceg. hypertension, heart disease and type II diabetes, and weight loss associated with cancer and AIDS. Additionally the agents identified may contact the content of animals can be associated where body weight of domestic animals can be condulated.

The present sequence is the human WSX receptor variant.6.4, which can be used to identify and purify ligands and activators. An anti-WSX receptor antibody can be used as an agonist to activate the WSX receptor, leading to enhanced proliferation or differentiation of a cell expressing the WSX receptor. It can also be used to decrease body weight and/or fat-depot weight and/or food intake in an obese mammal. WSX receptor ligands can be used to enhance proliferation or differentiation of lymphoid, myeloid or expthroid blood cell lineages. This is useful when a mammal, especially a human, is suffering from decreased blood cell levels, i.e. anaemia, caused by chemotherapy, radiation therapy or bone marrow transplantation therapy. It can also be used to repopulate blood cells in a mammal. The products can also be used to treat, e.g. neoplastic disorders, arteriosclerosis, Type II diabetes, polycystic ovarian disease, cardiovascular diseases, insulin resistance, hypercholesterolaemia, hypertrusion, insulin and cholelithiasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WSX receptor and related antibodies and products for diagnosis and therapy, e. haematopoiesis or for treating tumours

The present sequence is the human WSX receptor variant 12.1, which can be used to identify and purify ligands and activators. An anti-WSX receptor antibody can be used as an agonist to activate was receptor, leading to enhanced proliferation or differentiation of a cell expressing the WSX receptor. It can also be used to decrease body weight and/or fat-depot weight and/or fintake in an obese mammal. WSX receptor ligands can be used to enhance proliferation or differentiation of lymphoid, myeloid or erythroid blood cell lineages. This is useful when a mammal, especially a human, is suffering from decreased blood cell level

                                                                                                                                                           This sequence represents the obesity (OB) receptor C protein. This sequence has one or more of the biological properties of naturally occurring OB receptor protein. The OB receptor proteins and OB receptor/OB protein complexes are used for the treatment of obesity diabetes, high blood lipid levels and high cholesterol levels. The proteins may also be used to treat an individual for weight loss of weight maintenance required for purely cosmetic purposes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Obesity receptor; human; OB receptor; OB rehigh blood lipid level; obesity; diabetes; weight loss; therapy; weight maintenance.

This sequence has one or more of the biological properties of naturally occurring OB receptor protein. The OB receptor proteins and OB receptor/OB protein complexes are used for the treatment of obesity diabetes, high blood lipid levels and high cholesterol levels. The proteins may also be used to treat an individual for weight loss or weight maintenance required for purely cosmetic purposes.

                                                                                                                                                                                                                                                                                                         This sequence represents the obesity (OB) receptor B protein. This sequence has one or more of the biological properties of naturally occurring OB receptor protein. The OB receptor proteins and OB receptor/OB protein complexes are used for the treatment of obesity, diabetes, high blood lipid levels and high cholesterol levels. The proteins may also be used to treat an individual for weight loss or weight maintenance required for purely cosmetic purposes.

the mouse OB receptor (leptin receptor). A fusion protein comprising cc extracellular domain and the human IgG Fc domain has been cc constructed. The ability of the OB receptor signal peptide to cc direct secretion of the fusion protein in transfected HEK 293 cells cc was compared to the ability of the human TRL signal peptide (see CC AAY05696) to direct secretion of a similar construct. The results cc showed that the heterologous TRL signal elevated the amount of cc transfected cells approximately 10-fold. TRL is a novel member of the tumour necrosis factor receptor superfamily. The invention cc provides full-length human and murine TRL proteins (see AAY05695-97), TRL fusion proteins, antigenic peptides and anti-TRL antibodies, as well as TRL nucleic acids (see AAX25320-22), recombinant expression condulators of cellular signal transduction, cellular conduction, cellular system cells, and cells involved in insulin resistance or conductor tesponse.

This sequence has one or more of the biological properties of naturally occurring OB receptor protein. The OB receptor proteins and OB receptor/OB protein complexes are used for the treatment of obesity, diabetes, high blood lipid levels and high cholesterol levels. The proteins may also be used to treat an individual for weight loss or weight maintenance required for purely cosmetic purposes.

The deletion mutant D(41-322) has had the first CK-F3 module; present in the OB-R, removed. The D(41-322) mutant together with mutants lacking a functional second CK-F3 module or a functional intracellular domain can be used in assays for the detection of ligands, agonists, antagonists and ligand mimetics. The leptin agonists identified can be used in situations where leptin insufficiency causes obesity, diabetes or infertility. The leptin antagonists identified can be used in the treatment of anorexia and cachexia. The mutant receptor nucleic acids can also be used in gene therapy for weight control, e.g. for treating obesity or anorexia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 4;

                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence was used in the development of a novel method in cells. Them method comprises contacting RNA extracted from a cell population (preferably an ovary, prostate, testis, sperm, ova, coarian follicular or blood cell population) with an increase contacting the human OB-R variant in 2 or 3 cDNA, and detecting hybridisation. Forms 2 and 3 are cassociated with infertility, as they are unable to correctly transduce signals from leptin binding. The detection method can be consecuted to diagnose infertility, or predisposition to infertility, while treatments that inhibit or down regulate the variants, gene therapy to replace them in homozygotes or direct activation of downstream signal transduction can be used to improve fertility.

Also described is the use of labelled DNA probes based on the OB-R

                 The present sequence was used in the development of a novel method for detecting a defective obese protein or leptin receptor (OB-R) in cells. Them method comprises contacting RNA extracted from a cell population (preferably an ovary, prostate, testis, sperm, ova, coligonucleotide derived from a portion of the human OB-R variant form 1, 2 or 3 cDNA, and detecting hybridisation. Forms 2 and 3 are cassociated with infertility, as they are unable to correctly transduce signals from leptin binding. The detection method can be used to diagnose infertility, or predisposition to infertility, while treatments that inhibit or down regulate the variants, gene therapy to replace them in homozygotes or direct activation of downstream signal transduction can be used to improve fertility.

Calso described is the use of labelled DNA probes based on the OB-R sequence to screen for other variants!

                                                                                                                                                                                                                                                                                                   20
                                                                                                                                                                                                                                                                                                                                                                                           The present sequence was used in the development of a novel method for detecting a defective obese protein or leptin receptor (OB-R) in cells. Them method comprises contacting RNA extracted from a cell population (preferably an ovary, prostate, testis, sperm, ova, colloqueleotide derived from a portion of the human OB-R variant colliquiation and detecting hybridisation. Forms 2 and 3 are consociated with infertility, as they are unable to correctly transduce signals from leptin binding. The detection method can be used to diagnose infertility, or predisposition to infertility, while treatments that inhibit or down regulate the variants, gene therapy to replace them in homozygotes or direct activation of downstream signal transduction can be used to improve fertility.

Also described is the use of labelled DNA probes based on the OB-R sequence to screen for other variants.
                                                                                                                                                                                                                                                                                                                         Ouery Match

```
CC (OB-R). Its sequence was deduced from a contiguous cDNA (AAT89193) CC derived from overlapping clones isolated from a human foetal liver CC library. The sequence shows near identity to a published OB-R CC sequence in the extracellular domain, with the exception of 3 mmino CC acids, but there is extensive diversity in the intracellular CC detection of OB-R in cells comprises extraction of FNNA and testing CC this for hybridisation to an oligonucleotide (I) derived from the CC OB-R variant gene, especially from the region beyond nucleotide CC 2770. Also claimed are methods of: (I) treating obesity by CC administration of an agent that inhibits expression of the OB-R (CC variant gene; and (2) identification of a compound that can supplement activity of leptin by: (1) incubating cells expressing CC OB-R variant first with leptin and then with a test compound, and CC (ii) comparing activation signals between cells treated and not treated with the test compound. Inhibition/down regulation of the CC variant OB-R (found in obese people) improves response of cells to compour that required to the receptor gene can be used to treat obesity. Labelled CC in brobes based on the gene can be used to treat obesity. Labelled CC determining predisposition to obesity), while the OB-R gene can be used to express recombinant OB-R (optionally as fusion protein) and CC in standard hybridisation assays. The OB-R gene can be used to express recombinant ob-R (optionally as fusion protein) and CC causing loss of appetite and hypermetabolic activity. Cells careen for (ant)agonists of leptin/OB-R interaction, also to generate CC of the variant receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      English.

cytoplasmic domain at the C-terminal end, suggesting alternative splicing of a common precursor mRNA. A claimed method for detection of OB-R in cells comprises extraction of: RNA and testing this for hybridisation to an oligonucleotide (1) derived from the OB-R variant gene, especially from the region beyond nucleotide 2770. Also claimed are methods of: (1) treating obesity by administration of an agent that inhibits expression of the OB-R variant gene; and (2) identification of a compound that can supplement activity of leptin by: (1) incubating cells expressing OB-R variant first with leptin and then with a test compound, and (i) comparing activation signals between cells treated and not treated with the test compound. Inhibition/down-regulation of the variant OB-R (found in obese people) improves response of cells to weight regulation by leptin. Replacing variant OB-R by gene therapy (in homozygous individuals) can be used to treat obesity. Labelled probes based on the gene can be used to treat other variant forms of the receptor gene or to detect the variant gene (e.g. for determining predisposition to obesity), while the OB-R gene can be used to express recombinant OB-R (optionally as fusion protein) and in standard hybridisation assays. The OB-R gene can also be used to engineered to express variant receptor are used in method (2) to screen for (ant)agonists of leptin/OB-R interaction, also to generate antibodies that competitively inhibit, neutralise or enhance activity of the variant receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               (OB-R) ILS derived from

Zupancic '
This protein comprises a novel human haematopoietin receptor, designated Hu-B1.219 form 1, that has been detected in brain cells and shown to bind to the obese gene product, leptin. Its sequence was deduced from cDNA clones (see AAT75172) isolated from a human
                                                                       WPI;
                                                                                                                                                                                                                                   Haematopoietin

Hu-B1.219 is a marker for haematopoietic and endothelial progenitor cells, especially those cells capable of long-term repopulation. Hu-B1.219 nucleic acid sequences or binding agents for Hu-B1.219 protein can be used in claimed meth for identifying haematopoietic progenitor cells in a cell mixtur or tissue, and for detecting cancer. A claimed method for treat suffering from a cancer which expresses Hu-B1.219, to result in suppression of cancer growth. Leukaemia is a typical Hu-B1.219 expressing cancer.

                                                                                                                                                                   A novel haematopoetin receptor (AAR88912), HuB1.219 Form 3 protein, is the product of a cDNA clone (AAT12913) isolated from a human foetal liver library. 2 Other forms of HuB1.219 (see AAR88910 and AAR88911) have also been identified. The Hu-B1.219 protein, or a portion of it, is pref. prepd. by culturing a host cell engineered to express HuB1.219 cDNA. The Hu-B1.219 protein (whether in sol. form or expressed on the cell surface and opt. as part of a fusion protein) is used to screen peptide libraries to identify ligands of Hu-B1.219.

The Hu-B1.219 protein, or a portion of it, is pref. prepd. by culturing a host cell engineered to express HuB1.219 cDNA. The Hu-B1.219 protein (whether in sol. form or expressed on the cell surface and opt. as part of a fusion protein) is used to screen peptide libraries to identify ligands of Hu-B1.219.

of Hu-Bl.
                                                                           A novel haematopoetin receptor (AAR88910), HuBl 219 Form 1 protein, is the product of a cDNA clone (AAT12911) isolated from a human foetal liver library. 2 Other forms of HuBl 219 (see AAR88911 and AAR88912) have also been identified. The Hu-Bl 219 protein, or a portion of it, is pref. prepd. by culturing a host cell engineered to express HuBl 219 cDNA. The Hu-Bl 219 protein (whether in solform or expressed on the cell surface and opt. as part of a fusion protein) is used to screen peptide libraries to identify ligands of Hm-mi 210

                                                                                                                                                                                                                                                                                                                                                                                The ob-receptor (OB-R), a member of the cytokine receptor family is transcribed in the hypothalamus and is involved in obesity. The replacement mutant has had amino acids 420-496 the second CK-F3 module in OB-R deleted and replaced by amino acids 500-632. The replacement mutant together with mutants lacking a functional first CK-F3 module or a functional intracellular domain can be used in assays for the detection of ligands, agonists, antagonists and ligand mimetics. The leptin agonists identified can be used in situations where leptin insufficiency causes obesity, diabetes or infertility. The leptin antagonists identified can be used in the treatment of anorexia and cachexia. The mutant receptor nucleic acids can also be used in gene therapy for weight control, e.g. for treating obesity or anorexia.

                                                                                                                                                                                                                                                                                        Detecting a diagnosis c inhibitors
The present sequence represents a new variant form of the human leptin receptor, OB-R (obesity receptor). The sequence of the variant OB-R differs structurally from a published human OB-R sequence (Tartaglia e al., 1995, Cell 83: 1263-1271). There are 3 amino acid substitutions i the extracellular domain and extensive diversity in the intracellular cytoplasmic domain, ie. the region encoded by the sequence downstream nucleotide 2770. A new method for detecting a defective OB-R in cells comprises (a) extracting RNA from a cell population; (b) contacting the RNA with an oligonucleotide derived from nucleotide residue 2770 and beyond of AAT74022; and (c) detecting hybridisation of the RNA with th oligonucleotide. A new method for treating obesity consists of

                                                                                                                                                                         Human haemopoietin receptor NR2 (AAW14841) interacts with leptin, and can be used to develop (ant)agonists, therapeutics and diagnostic reagents based on ligand interaction. Its amino acid sequence was deduced from an isolated DNA molecule (AAT64442).

Crecombinant NR2 can also be used in a claimed method to identify ligands capable of interacting with a haemopoietin receptor, and soluble NR2 polypeptides can be used in the treatment of disease, injury or abnormality in the nervous system, cerebral palsy, trauma cliduced paralysis, vascular ischaemia associated with stroke, neuronal tumours, motor neurone disease, Parkinson's disease, funtington's disease, Alzheimer's disease, multiple sclerosis, peripheral neuropathies associated with diabetes, heavy metal or alcohol toxicity, renal failure and infectious diseases such as the treatment of diseases, rubella, measles, chicken pox, HIV or HTLV-1.

            The ob-receptor (OB-R), a member of the cytokine receptor family is transcribed in the hypothalamus and is involved in obesity. The soluble secreted form of leptin binding domain is used in the scree of OB-R ligands. The leptin agonists identified can be used in situations where leptin insufficiency causes obesity, diabetes or infertility. The leptin antagonists identified can be used in the treatment of anorexia and cachexia. The OB-R mutant receptor nucle treatment of anorexia and cachexia.

The present sequence represents a leptin receptor (OB-R) protein, OB-Ra. CIT The OB-R can be used to treat obesity, optionally in conjunction with CIC a treatment for diabetes, high blood pressure and high cholesterol, CIC or in cosmetic compositions for reducing body weight. It may also be CIC used in agriculture to produce leaner food animals, e.g. beef cattle, CIC swine poultry, sheep. An antibody specific for OB-R can be used to nucleic acid molecule encoding OB-R can be used to detect defects in the CIC OB-R polypeptide associated with obese phenotypes, or diagnostically to fucleic acid molecule can be used in gene therapy, or the antisense CIC nucleic acid molecule can be used to antagonise leptin activity. The nucleic acid molecule, or the antisense nucleic acid molecule, can be used to treat weight loss e.g. associated with AIDS, cancer or anorexia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match
